Early attachment trauma and the impact on child's development.

Doris D'Hooghe

www.traumacentrum.be

"I want to be a normal girl"

hello doris,

I just came from my grandma. We step into the car. I start to blame again. I have had it in my mind to commit suicide. I don't want that anymore I want to be a normal girl help me I want to be like the others. I don't feel so well lately they don't do anything about it... My mom is being annoying why "I don't know why." Will you make an appointment with my mom because I would like if you had the time you would talk to my mom. I don't want my mom to be annoying to me anymore...

HELP I DON'T WANT THIS ANYMORE I WANT TO BE A NORMAL GIRL. THIS HAD TO STOP!!!!!!!!

Kind regards

trauma, entrum

Content

- Broadening the vision on attachment trauma
- Quality of the attachment relationship
- Early attachment trauma
- Dissociation :
 - Attachment and dissociation
 - Affectregulation and dissociation
 - Stressregulation and dissocation

Why broadening our vision on the definition of EAT ?

• Because of the definition of trauma

 Because of the importance of the attachment relationship on child's development

- Our knowledge about neurobiology
- Because of the importance of quality of parenting

Trauma definition

- PTSD (Posttraumatic Stress Disorder)

• Criterion A: (traumatic event)

"exposure to actual or threatened death, serious injury, or sexual violence"

– Leonore Terr

" a sudden, unexpected, overwhelming intense emotional blow or a series of blows assaults the person from outside"

Trauma

- Van der Kolk: Developmental trauma disorder

- "Significant disruptions of protective caregiving as the result of repeated changes in primary caregiver
 - repeated separation from the primary caregiver
 - or exposure to severe and persistent emotional abuse"

- Bowlby

"any event that seriously threatens the attachment relationship"

Attachment relationship

The attachment relationship

- Bowlby:
 - 'reciprocal interchange'
 - Infant seeking interaction
 - Maternal behavior is reciprocal
 - Sensitivity
 - Access
 - Not just proximity
 - Access → emotionally available and responsive
- Schore: 1994 — Co-regulation

trauma centrum

Importance of the Attachment relationship

- Importance of the relationship on the development of the child
 - The dynamic interaction → internal world
 - Relational experiences \rightarrow the mind
 - The dyadic relationship → affective themes
- Interplay with nature and nurture
- Continious relationship
- Availability and accessibility

Neurobiology

- Experience dependent
- Growth spurt
- Critical period concept
- Plasticity
- Developmental psychoneurobiological model (A. Schore)

secure attachment → development right brain
→ adaptive infant mental health

Quality of the attachment relationship

© Traumacenter Belgium www.traumacentrum.be- Doris D'Hooghe

Quality of the attachment relationship

• Attachment style of the parent

 How do parents mentally process attachmentrelated information

• Quality of parenting

Attachment style of the parent

Internal working model (IWM)

- Memories of attachment interactions \rightarrow accessibility
- Mental representations of self/others
- Cognitive structure
- Typical emotions
- Implicit memory
- Open to modification

Attachment style of the parent

- "From the cradle to the grave"
- Adult attachment styles
 - Autonomous attachment :
 - have a model of others as warm, reliable
 - model of oneself as lovable and worthy of care.
 - Dismissive attachment:
 - the self as worthy
 - view others as unreliable or rejecting, untrustworthy or dissapointing

Attachment style of the parent

- Adult attachment styles
- Preoccupied attachment:
 - the self as unworthy or unlovable
 - but hold a positive evaluation of others.
- Fearfull attachment
 - hold negative views of both the self and others.

trauma centrum

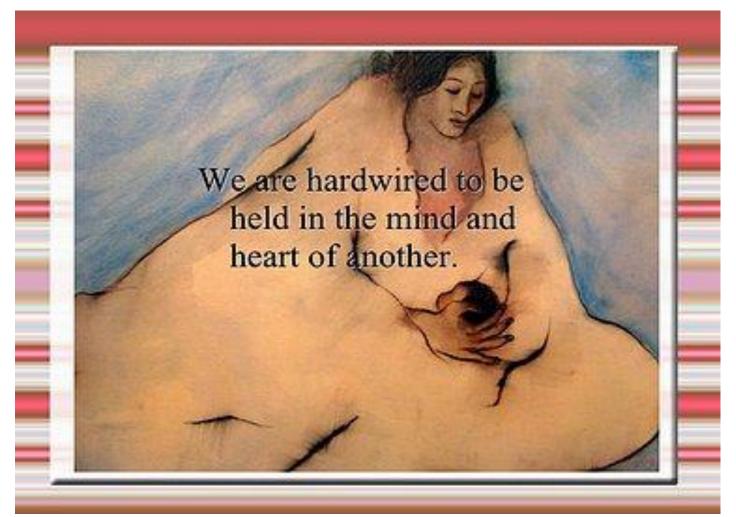

Intergenerational transmission

Parent's early attachment experiences Parent's attachment representation **Parenting behavior** Infant's attachment experiences

Processing attachment related information

- Crittenden (1993)
 - Dynamic Maturational Model
 - Attachment theory
 - Protecting the self and offspring of danger
 - Finding a reproductive partner
 - Failures of perception
 - Misinterpretation
 - Failure to select a response
 - Failure to implement a response

- Sensitive responsiveness
- Reflective functioning
- Mentalization
- Containment
- External regulation
- Play

Sensitive responsiveness

- Ainsworth and others (1974)
- The infant's point of view
- Four essential components:
 - Her awareness of the signals
 - An accurate interpretation of them
 - An appropriate response to them
 - A prompt response to them

- Mentalization (Fonagy)
 - A theory of mind (internal world)
 - Oneself and others as psychological
 - Mirroring
 - Sense of self

- Reflective functioning:
 - Reflect upon their own history (trauma, attachment)
 - Influence
 - Trigger
 - "Ghosts in the nursery" (Selma Fraiberg)

- Containment (Bion, 1959)

- Receive and understand
- Without being overwhelmed by it
- Communicates back

- External regulation
 - Regulatory theory (Allan Shore)
 - Be attuned to the internal state
 - Able to regulate the own arousal state
 - Down regulate and up regulate

- Play

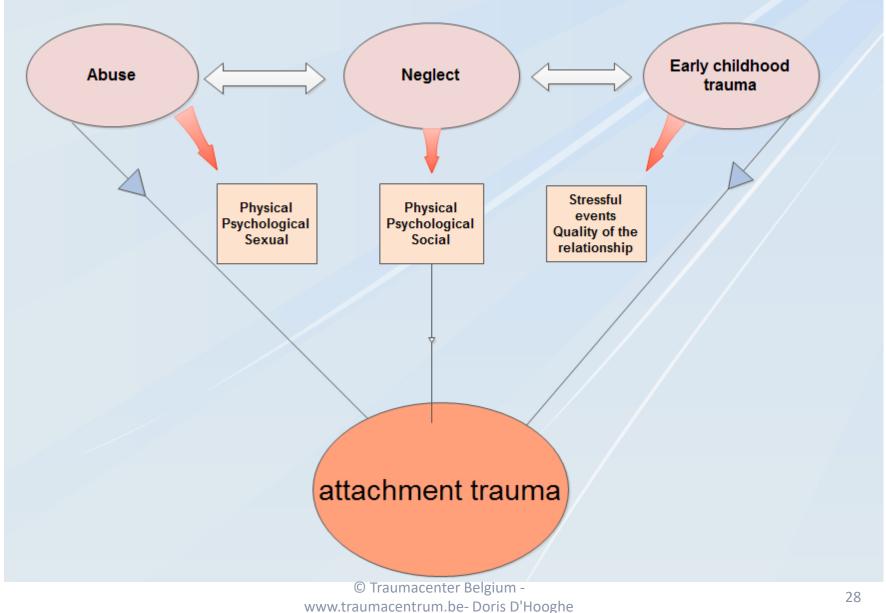

- Confidence, trust, security
- Communicate and connect
- Reduce stress
- Strengthens attachment

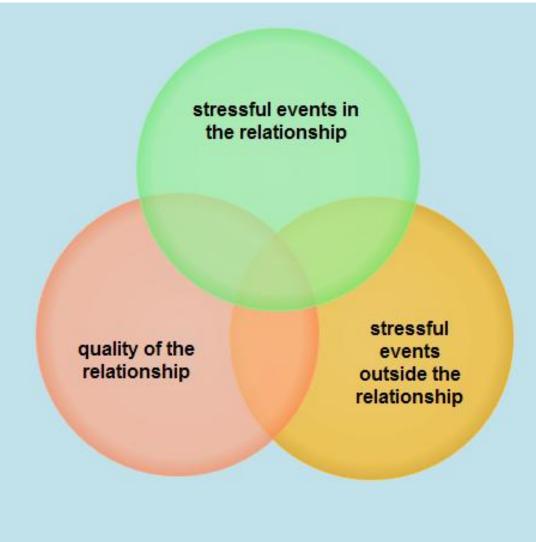

Secure base

Early attachment trauma

Early attachment trauma

Early attachment trauma?

- Caregiving relationship
- Early
- Repetitive
- Chronic (over time)
- Multiple
- Adverse impact on the development of a secure attachment relationship

Stressful events in the relationship

• Prenatal trauma

• Birth trauma

• Disruptions in the attachment bond

Disruptions in the attachment bond

Bowlby

Continious relationship

- Fysical availability
- Emotional availability

 When not fulfilled = disruption in the attachment bond

Emotional availability (EA)

• EA:

refers to an individual's emotional responsiveness and attunement to another's needs and goals (Emde 1980)

- Personal characteristic (affect-stress regulation)
- Mother's internal working model
- Mother's relationship with the father
- Context of the relationship with others

Emotional inaccessible

- Inappropriate response
- Stressful life episodes
- Suicide threat
- "Ghosts in the nursery"
- Parent psychopathology
- Relationship problems

Specific on EAT

- Perception of threat
- Non-verbally
- Implicit memory
- Neurobiology

• Body

Specific on EAT

- Self- regulation
- Layer on layer
- Basic trust
- Internal working model
- The possibility to integrate the experience

Severity of EAT

- EAT and the overlap with complex trauma
 - Interpersonal stressor
 - Multiple
 - Repeated
 - Cumulative
 - Developmentally vulnerable times
- Early stage:
 - The impact on the brain
 - Developmentally
 - Margret Mahler: Individuation –separation model

EAT

- Hidden epidemic
- Looking broader then abuse and neglect
- The courage to ask about it
- Using a new classification
- Starting redefining trauma in children

trauma centrum

© Traumacenter Belgium www.traumacentrum.be- Doris D'Hooghe

Dissociation

- Deficit of integration
 Dissociation is usually defined as:
- " a deficit of the integrative functions of memory, consciousness and identity,

and is often related to traumatic experiences and traumatic memories".

Integration.

- (Steele, Van der Hart, Boon)
 - Organization of all the different aspects of personality into a unified whole that functions in a cohesive manner
 - It is a natural tendency
 - Stable sense of who we are
 - Distinguish the past from the present
 - Develop our sense of self
 - Secure and safe emotional and physical management
 Centrum

EAT and integration

- Young children = ψ ability to integrate:
 - Brains
 - Sense of self
- EAT:
 - $-\psi$ emotional support
 - Parents lacking skills ightarrow quality of parenting Ψ
 - Disruptions \rightarrow inacessibility and unavailibility
- Integration fails

Dissociative disorder = Attachment disorder ?

- Peter Barach (1991)
- EAT
 - Quality of the attachment relationship
 - Availibility of the caregiver
 - Disruptions of the bond/ Separation
- Insecure attachment
- Survival strategy

Dissociative disorder = Attachment disorder ?

- PDD (protest dispair detachment)
- Detachment :
 - Deactivation of the attachment system
 - Seeking care, help, comfort
 - Activated \rightarrow fear, physical or psychological pain
 - Excluding from awareness
- Detachment = dissociation
 - Information is deflected from integration
 - Deflected from the stimuli for attachment behavior

Disorganized attachment

- Care-seeking or attachment system
- "From the cradle to the grave"
- "Unresolved" parents
- "The source and the solution"
- Psychobiological reactions
- The simultaneity of approach and avoidance
 →lack of organization
- Disorganization = Collapse of the integrative functions of consciousness

Dissociation

- Liotti's:
 - "Failure in organizing multiple and incongruent models of the self and other
 - into unitary mental states and coherent behavioral states
 - rahter than an intrapsychic defense against unbearable pain and severely traumatic experiences"

Secure attachment and affect regulation

- Attachment
 helping the brain to integrate and to process
- Attachment → dyadic regulation of emotion
- Caregiver

 external regulator:
 - Reading the child's signals
 - Providing optimal stimulation
 - Modeling of behavior
 - Affect attunement
 - Meet their infants' needs

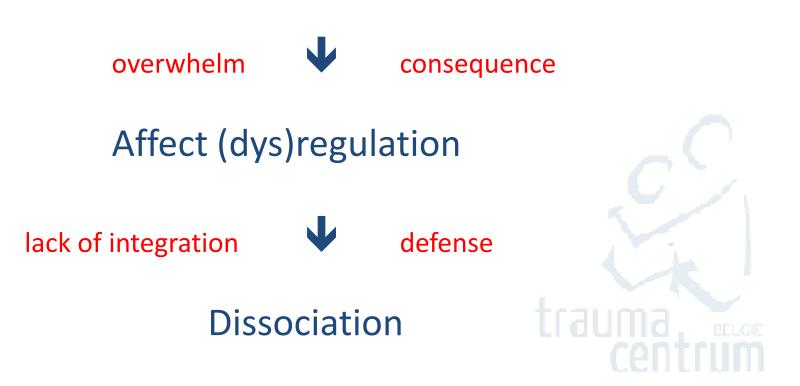

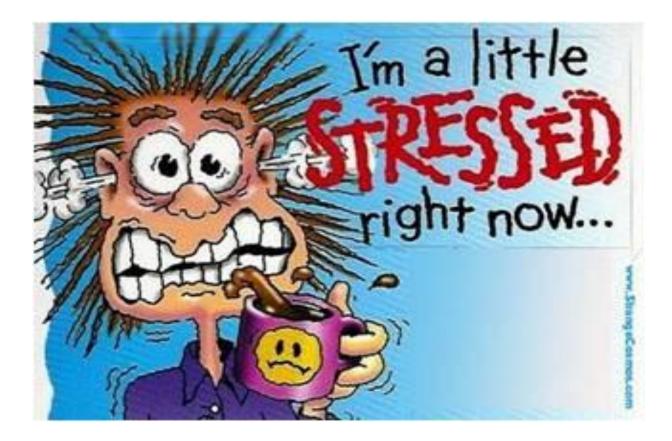

EAT and affect regulation

- Panksepp (1998, 2009)
 - Affective neuroscience
 - 7 emotional circuits at birth
 - Subcortical neurocircuitry of the mammalian brain
 - Environmental experiences.
 - EAT \rightarrow the circuits don't flow
 - − Trauma " piles up" → no integration → dissociated states
 - EAT → child cannot safely develop a self → introjection of the caregiver
 - Introjection → survival task → truncate information → no
 embodiment → no felt sense

Dissociation and affect regulation

Early Attachment Trauma

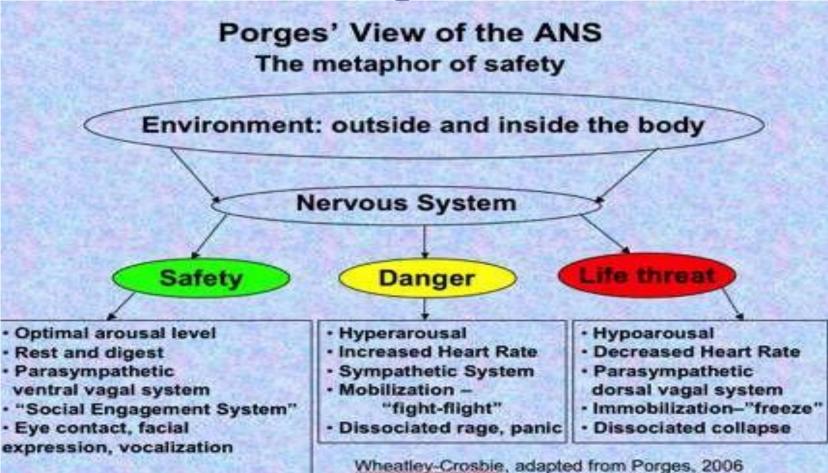

- Autonomic nervous system (ANS)
 - It regulate the autonomic, somatic aspects of the stress responses
 - Specific behavior and physiological responses
 - Responds adaptively to danger and stressful circumstances.
 - ANS: = system of balance
 - Sympathetic ="accelerator" = fight/ flight
 - Parasympathetic = "brakes" = rest /digest

- Stephen Porges (2001)
 - Neuroscientist
 - The Polyvagal Theory:
 - ANS = hierarchical system that responds to environmental challenges
 - Three different subsystems
 - Parasympathetic ventral vagal (Social engagement system)
 - Sympathetic arousal (fight/flight)
 - Parasympathetic dorsal vagal (freeze responses

- Social engagement system
 - Parasympathetic ventral vagal
 - Physiological foundation for secure attachment.
 - An inborn neural organization or action system
 - Regulate ourselves
 - Connect well with others
 - Social behavior
 - Social communication

Porges

- EAT:
 - Inhibit the availability of the social engagement system
 - Constricting the child's capacity to
 - respond adaptively to stress
 - self regulate
 - form healthy attachment and social bonds

trauma centrum

Dissociation and the neurobiology

- Traumatic stress → changes in brain areas
- Psychic dissociative symptoms
- Neurobiological consequences.
 - HPA axis: stress system of the body
 - Neuroendocrinological and neurophysiological dysfunctions
 somatic components
 - Lack of integration
 somatoform dissociation

Prevention

- Collect data
- Public awareness campaigns
- Share knowledge
- Screening
- Treatment
- Parent/child education
- Parent child centers
- Home visits

I'm doing great!

hello doris,

I send you an email to tell you I'm doing great.

I hardly get angry anymore.

- I went to Eeklo today with my grandma to buy clothes and we went for a drink and of course a pancake.
- Things are better with my mom.
- I went to Technopolis with school and then to Living tomorrow it was fun

Well that's all I've done so things are all very well.

With lots of sweet greetings
